

Curriculum Vitae **Rainer Blatt**

Institute of Experimental Physics
University of Innsbruck and
Institute of Quantum Optics and Quantum Information
Austrian Academy of Science

Rainer Blatt (born 8 September 1952) is a German-Austrian experimental physicist. His research centers on the areas of quantum optics and quantum information. He and his team were the first to teleport atoms and to create a „quantum byte“.

BIOGRAPHY Rainer Blatt graduated in physics from the University of Mainz in 1979. He finished his doctorate in 1981 and worked as research assistant in the team of Günter Werth. In 1982 Blatt received a research grant of the Deutsche Forschungsgemeinschaft (DFG) to go to the Joint Institute for Laboratory Astrophysics (JILA), Boulder, and work with John L. Hall (Nobel Prize winner 2005) for a year. In 1983 he went on to the Freie Universität Berlin, and in the following year joined the working group of Peter E. Toschek at the University of Hamburg. After another stay in the US, Rainer Blatt applied to qualify as a professor by receiving the “venia docendi” in experimental physics in 1988. In the period from 1989 until 1994 he worked as a Heisenberg research fellow at the University of Hamburg and returned several times to JILA in Boulder. In 1994 he was appointed professor of physics at the University of Göttingen and in the following year he was offered a chair in experimental physics at the University of Innsbruck. Since 2003 Blatt has also held the position of Scientific Director at the Institute for Quantum Optics and Quantum Information (IQOQI) of the Austrian Academy of Sciences (ÖAW). Rainer Blatt is married, with three children.

RESEARCH Experimental physicist Rainer Blatt has carried out trail-blazing experiments in the fields of precision spectroscopy, quantum metrology and quantum information processing. He works with atoms caught in ion traps which he manipulates using laser beams. This work is based on suggestions made in the mid-1990s by theorists Ignacio Cirac and Peter Zoller. In 2004, using their suggested set-up, Blatt’s working group succeeded for the first time in transferring the quantum information of one atom in a totally controlled manner onto another atom (teleportation). The science journal Nature reported the experiment and gave it pride of place on the cover. Two years later, Rainer Blatt’s working group already managed to entangle up to eight atoms in a controlled manner. Creating such a first “quantum byte” (qubyte) was a further step on the way towards a quantum computer. 2011 the team managed to push this record to 14 entangled atoms. Furthermore Rainer Blatt took important steps towards successful quantum error correction and the building of quantum simulators. He is also known for his support of young scientists. Six of his former assistants have since been appointed professorships at universities abroad.

AWARDS Rainer Blatt has received numerous awards for his achievements in the fields of quantum optics and metrology. In 2012 the German Physical Society awarded him the “Stern-Gerlach-Medaille”, in 2011 he was awarded the Science Award for Outstanding Achievements of the Stiftung Südtiroler Sparkasse. Together with Ignacio Cirac he won the Carl Zeiss Research Award (2009). In 2008 he received an „ERC Advanced Grant“ by the European Research Council and the Kardinal Innitzer Award. In 2007 Rainer Blatt and his European project partners were nominated by the European Commission for the Descartes Prize. In 2006 he received the Schrödinger Prize of the Austrian Academy of Sciences. In 1997 he won the Innovations Award of the Tiroler Sparkasse for new ideas on quantum information processing. Since 2008 Rainer Blatt is full member of the Austrian Academy of Sciences.

PERSONAL DATA SHEET

PERSONAL DETAILS Otto Rainer Blatt, born 8 September 1952 in Idar-Oberstein, Germany, married, three children, German and Austrian citizenship

EDUCATION 1959-1963 Primary school in Idar-Oberstein, Germany
1963-1971 High school in Idar-Oberstein, Germany
1971-1973 Military service in Germany
1973-1979 Studies of physics at Univ. of Mainz, Diploma degree 1979
1979-1981 Dissertation in physics at Univ. of Mainz, Doctoral degree 1981

ACADEMIC EDUCATION AND POSITIONS HELD 1981-1982 Univ. of Mainz (w/ Prof. G. Werth), Research Associate
1982-1983 Joint Institute of Laboratory Astrophysics (JILA), Boulder, CO, USA, Research fellowship of the Deutsche Forschungsgemeinschaft (DFG) (Dr. J. L. Hall)
1983-1984 Freie Universität Berlin (w/ Prof. E. Matthias), Research Associate
1984-1987 University of Hamburg (w/ Prof. P. Toschek), Research Associate
1988 Habilitation thesis, Hamburg, Privatdozent at University of Hamburg
1989-1994 University of Hamburg, Heisenberg fellow
1991-1994 JILA, Boulder, CO, USA, several research visits
1994-1995 University of Göttingen, Professor of Physics at 3. Physikalisches Institut
since 1995 University of Innsbruck, Full Professor of Physics
since 2000 Director of Institute of Experimental Physics, University of Innsbruck
since 2000 CEO of Institut für Quanteninformaton Ges.m.b.H, Innsbruck
since 2001 member of the academic senate of University of Innsbruck
since 2003 Scientific Director of the newly founded Institute for Quantum Optics and Quantum Information (IQOQI) of the Austrian Academy of Sciences
2003-2009 Managing Director of the Institute for Quantum Optics and Quantum Information (IQOQI)
2003-2008 corresponding member of the Austrian Academy of Sciences
since 2008 full member of the Austrian Academy of Sciences

AWARDS AND OFFERS 1989 Heisenberg fellowship award of the Deutsche Forschungsgemeinschaft (DFG)
1995 Offer to become Full Professor of Physics at Univ. Jena, Germany (declined)
1997 Innovations-Preis by Tiroler Sparkasse for new ideas concerning quantum computing
2006 Schrödinger-Preis of the Austrian Academy of Sciences
2007 Descartes prize finalist award for QGATES consortium
2008 ERC Advanced Investigator Grant
2008 Karl Innitzer Award
2009 Carl Zeiss Research Award, with Ignacio Cirac
2011 Stiftung Südtiroler Sparkasse Science Award
2012 Stern Gerlach Medal, German Physical Society

PROFESSIONAL ACTIVITIES	1997-2003	coopted board member of QEOD of the EPS
	1999	chairman of ICOLS99, International Conference on Laser Spectroscopy
	1999-2003	editorial board member of Journal Phys. B: „Quantum and Semiclassical Optics“
	2000	chairman of IQEC, Nice, International Quantum Electronics Conference
	since 2003	regular board member of the QEOD of the EPS
	2003-2009	board member of the ICQE, International Council of Quantum Electronics
	since 2004	associate editor of “Quantum Information and Computation”
	since 2004	editorial board member of “Quantum Information Processing”
	since 2005	editorial board member of “Applied Physics B (Lasers and Optics)”
	2005-2006	member and chairman (2006) of the Schawlow prize committee of APS
	2006	chairman of 20th ICAP, International Conference on Atomic Physics Memberships
	since 1979	member of the Deutsche Physikalische Gesellschaft (DPG)
	since 1982	member of the American Physical Society (APS), fellow 2003
	since 1996	member of the Austrian Physical Society (ÖPG)
	since 1998	member of the European Physical Society (EPS)
	since 2000	member of the Institute of Physics (IOP, chartered physicist)
	since 2001	member of the Optical Society of America (OSA)
	2004-2010	board member, Quantum Information Processing Interdisciplinary Research Collaboration (QIP IRC), Oxford
	since 2006	member (and chairman) of the Scientific Advisory Board MPQ, Garching
	since 2009	speaker FWF SFB project F40
since 2009	member of the Austrian Science Board	
since 2011	member of the Scientific Advisory Committee, ARC Centre of Excellence for Engineered Quantum Systems, Australia	
RESEARCH FUNDING	1982-1983	DFG research fellowship
	1989-1994	DFG Heisenberg fellowship
	1989-1994	DFG project: “ $^{171}\text{Yb}^+$ ion for frequency standards”
	1994-1995	DFG project: “Quantum optics with trapped Ba^+ ions”
	1994-1995	DFG project: “Quantum information processing with trapped Ca^+ ions”
	1996-1998	FWF project: “Quantum optics with a single trapped (Ba^+) ion”
	1995-1998	FWF project: “Quantum information processing with trapped Ca^+ ions”
	1996-1999	FWF project: “Quantum Optics with ultra-cold (Rb) atoms”
	1999-2008	funding within FWF SFB project F15: “Control and measurement of coherent quantum systems”
	1996-2000	EU TMR Netzwerk QI: „The physics of quantum information“
	1999-2003	EU network QIPC NoE: “Quantum information processing and comm ...”
	since 2000	funding through Institut für Quanteninformation Ges.m.b.H., Tirol, Austria
	2000-2002	EU network QUBITS: “Quantum based information processing ...”
	2000-2004	EU network QUEST: “Quantum entangled states of trapped particles”
	2003-2005	EU network QGATES: “Quantum gates and elementary scalable processors ...”
	2003-2007	ARO (US) project: “Quantum information processing with trapped $^{43}\text{Ca}^+$ ions”
	2004-2007	EU network CONQUEST: “Controlled Coherence and Entanglement in sets ...”
	2005-2009	EU IP project SCALA: “Scalable quantum computing with light and atoms”
	2005-2007	EU ERA-pilot QIST: “Structuring European Research Area within QI ...”
	2005-2006	Accion Integrada: “Quantum feedback with single ions”
	2006-2009	EU STREP project MICROTRAP: “Development of pan-European technology ...”
	2006-2009	EU NoE QUROPE: QIPC NoE
	2006-2009	ARO (US) project: “Scalable quantum information processing with trapped $^{43}\text{Ca}^+$ ions”
	since 2008	continuing funding within FWF SFB project F40: “Foundations and Applications of Quantum Science”
	since 2010	EU network AQUITE: „Atomic Quantum Technologies“
	since 2010	ARO (US) project: „Multi-qubit coherent operations with trapped ions“
	since 2011	FWF project: „Single Photon Interactions (SINPHONIA)“

SCIENTIFIC PROFILE After graduating in 1981 at the University of Mainz, Rainer Blatt joined the group of Dr. John L. Hall (Nobel-laureate of 2005) in 1982 where he started a project on the cooling of a beam of Sodium atoms. At that time this was a very hot topic, since first atomic beam cooling results were presented just in 1981 by the group of W. Phillips (Nobel laureate of 1998). Together with W. Ertmer (now Hannover) Blatt was successful in achieving atomic beam cooling with a frequency chirp technique that for the first time allowed them to stop atoms out of a beam. After returning to Germany he started to work at the University of Hamburg (w/ P. Toschek and W. Neuhauser) with single trapped ions and they were among the first to see quantum jumps in single atoms, a technique now routinely used in quantum information processing and for metrology purposes. With this work he did his Habilitation thesis in 1988 and continued there as a Heisenberg fellow, using the freedom that comes with this fellowship to further work with single trapped Ba⁺ and Yb⁺ ions on fundamental quantum optics experiments and for an implementation of a frequency standard.

Throughout his work, Rainer Blatt has learned from the very best experimentalists and thus has always tried to tackle hard experimental problems that seemed almost impossible at first. While experiments with single trapped ions take quite some time to be mastered, they provide some of the cleanest and most fundamental subjects for basic research, which has never ceased to fascinate him. Thus, when the discussions about quantum computers started around 1994, Blatt had the luck and the opportunity to work with his longstanding colleague P. Zoller (at that time with CU, Boulder, CO) and I. Cirac (then in Madrid, Innsbruck and Boulder) who proposed trapped ions for quantum computation and immediately started their quantum computer project at his new position at the University of Göttingen, Germany. Therefore, they were among the first to start implementing experiments toward quantum information processing with trapped ions, ideas initially developed by P. Zoller and I. Cirac.

This work gained momentum with the new position at University of Innsbruck in 1995 where now P. Zoller and (in 1996) I. Cirac worked as the inventors of the ion trap quantum computer. While such experiments are quite demanding, together with a number of highly talented students and assistants they took on that challenge and developed the technology steadily in the 1990s, and achieved milestones as the side-band cooling (1999) and first quantum operations (2001-2002). Together with their colleagues P. Zoller, I. Cirac and A. Zeilinger (until 1999, then R. Grimm since 2000), they were able to create an environment and an atmosphere that enabled them to attract and inspire students, postdocs and visitors and in essence put Innsbruck on the quantum map. The hard experimental work paid off and ever since our quantum information group belongs to the finest and most experienced groups worldwide. Together with their competing group of David Wineland at NIST, Boulder, CO, they have been able to lead quantum information science with trapped ions worldwide.

Most remarkable milestones throughout the last years where the first implementation of the Deutsch-Jozsa algorithm of the Cirac-Zoller gate operation (2003), teleportation of the state of an atom (2004), the creation of W and GHZ states on demand (2004), the first creation of a quantum byte (2005), the application of entanglement for precision quantum metrology (2006), a Mølmer-Sørensen-type gate operation entangling ions with a fidelity of 99% (2008), the realization of the quantum Toffoli gate and the state-independent experimental test of quantum contextuality (2009), the quantum simulation of the Dirac equation (2010), the creation of trapped-ion antennae for the transmission of quantum information, 14-qubit entanglement, repetitive quantum error correction, and the realization of an universal digital quantum simulator with trapped ions (2011).

SCIENTIFIC PROFILE All this led the Austrian Academy of Sciences to consider the joint application to establish an Academy Institute dedicated to doing research in the area of Quantum Optics and Quantum Information. Eventually, this institute was founded in November 2003 and a new building was planned and set up in record time. Most of the scientific planning for the building, the laboratories and the experimental work plan was done by Blatt and his colleague R. Grimm. They were able to get the required financial support from the federal and local governments and the city of Innsbruck. Thus, in 2005 the new laboratories were ready and since then they have been able to attract even more visitors, guests and long-term researchers to Innsbruck and to collaborate with them. All in all, in the field of quantum optics and quantum information, there are more than 100 scientists working at the university and the academy institute who, of course, collaborate very closely. Innsbruck has become a world-wide centre for quantum optics and in particular, for quantum information research.

Throughout the last years, about 20 PhD students and more than 30 diploma students have graduated from Blatt's group. He has had the pleasure to attract more than 30 postdocs in the past years and most important, some of the finest young scientists became assistants in his group where they have the chance to work similar to an assistant professor, leading sub-projects and supervising their own students. Already six of the first assistants have accomplished their Habilitation work and hold now professorships in Germany, the US and in Spain. Aside from several awards for PhD students, two of his former assistants received the prestigious Rudolf-Kaiser prize (about 25 k€ each) for their work. Two of the assistants have received an ERC Starting Grant (1.5 M€ each), three assistants have won the prestigious START award of the Austrian Federal Ministry for Education and Culture (1.2 M€ each).

The scientific work of the entire group is highly appreciated and they receive routinely more than twenty invitations to international meetings every year. In 2006, Blatt was awarded the highest Austrian research prize, the Erwin-Schrödinger award of the Austrian Academy of Sciences, for our quantum information research. Aside from the research activities, he teaches at the University of Innsbruck, mostly introductory courses on atomic physics, quantum physics as well as solid state physics and advanced courses on experimental quantum optics. Moreover, Blatt is involved in giving talks for the broader public, especially for teachers and high school students and together with his colleagues they are strongly interested in disseminating quantum information. For this, P. Zoller and R. Blatt are supported by the association of Tyrolean industrialists who finance a company (Institute for Quantum Information Ges.m.b.H.). With this support, they can hire staff and students, invite guests and quite generally foster the connections between university and industry. On the European stage, the new institute IQOQI serves as centre for European Research Area (ERA) and other networking activities; they are especially involved in the formulation of the European "roadmap" towards Quantum Information Processing and Communication (QIPC).
